

What's Next for – Cartography and Cartographers: To make our world a better place

Tim Trainor
President, International Cartographic Association

AutoCarto 2020 Virtual Conference

Greetings

ICA Executive Committee

ICA Vision

The aim of the ICA is to ensure that cartography and GIScience are employed to maximum effect and full potential for the benefit of society and science **through promotion and representation of the disciplines and professions of cartography and GIScience internationally.**

**We are facing unprecedented challenges
locally and globally**

**Maps show the plight of people and can
contribute to a way out of our current troubles**

So, What's Next?

Agenda

- ICA – UN collaborations
 - Three UN initiatives
- Examples of challenges and topics to consider
- A few trends to probe
- The role of the ICA in responding to What's Next?

Building on Current Efforts

This presentation highlights a few ideas to consider based on two recently published works for exploration, further research, and implementation.

- A CAGIS article prepared for the 2019 International Cartographic Conference in Tokyo¹
- Future Trends document from UN-GGIM10, August 2020²

¹ Keith C. Clarke, J. Michael Johnson & Tim Trainor (2019) Contemporary American cartographic research: a review and prospective, *Cartography and Geographic Information Science*, 46:3, 196-209, DOI: 10.1080/15230406.2019.1571441

² Future trends in geospatial information management: the five to ten year vision THIRD EDITION

The ICA and the UN

The ICA collaboration with the UN Committee of Experts on Global Geospatial Information Management (UN-GGIM)

**Made possible through the Geospatial Societies Thematic Group
(<http://ggim.un.org/UN-GGIM-Thematic-Groups/>)**

Three UN Initiatives

- Sustainable Development Goals (SDGs) ✓
- Integrated Geospatial Information Framework (IGIF)
- Global Statistical Geospatial Framework (GSGF)

Seventeen goals to transform our world for the better

UN-GGIM

United Nations Secretariat
Global Geospatial Information Management

Positioning geospatial information to address global challenges

ggim.un.org

Where are we?

- Countries have been collecting data for each of the 17 goals where possible
- The data are based on very specific indicators
 - Some indicators are very challenging
 - Some indicators show data gaps
 - Experiences are varied
- Results show “current” conditions
 - Dependent on the coverage, resolution, and temporal value of the data

What's Next for the SDGs? - - Start Here...

- *“by 2020, enhance capacity building support to developing countries, including for Least Developed Countries (LDCs) and Small Island Developing States (SIDS), to increase significantly the availability of high-quality, timely and reliable data disaggregated by income, gender, age, race, ethnicity, migratory status, disability, geographic location and other characteristics relevant in national contexts.”*

Positioning geospatial information to address global challenges

ggim.un.org

According to the UN Future Trends Document²...

- Three key factors now challenge the limitations of a traditional SDI.
 - First is the recent and growing availability of more diverse data and data types and needs that are now more relevant and dependent on geospatial data than were originally considered.
 - Second limitation is the growing demand for data integration, fusion and analysis.
 - Third is that the main focus of SDIs has just been geospatial data.
- “What’s Next” involves how we work toward solving these limitations using cartography as an enabler for success

Three UN Initiatives

- Sustainable Development Goals (SDGs)
- Integrated Geospatial Information Framework (IGIF) ✓
- Global Statistical Geospatial Framework (GSGF)

9 Strategic Pathways

Anchored by 9 Strategic Pathways, the Framework is a mechanism for articulating and demonstrating national leadership in geospatial information, and the capacity to take positive steps.

IGIF: Implementation Guide - Foundations

- The Implementation Guide expands on each of the 9 strategic pathways of the IGIF and provides the ‘what’ – the specific guidance and options to be taken by countries in implementing the IGIF. It captures strategic to operational needs with guiding principles, actions, deliverables, outcomes and resources.
- The aim is to provide guidance for governments to establish ‘nationally’ integrated geospatial information frameworks in countries in such a way that transformational change is enabled, visible and sustainable.
- The aim is to provide guidance for governments to establish ‘nationally’ integrated geospatial information frameworks in countries in such a way that transformational change is enabled, visible and sustainable. The Guide’s benefits will cascade right down to the citizen.

Strategic Pathway 1

Governance and Institutions

This strategic pathway establishes the leadership, governance model, institutional arrangements and a clear value proposition to strengthen multi-disciplinary and multi-sectoral participation in, and a commitment to, achieving an Integrated Geospatial Information Framework.

The objective is to attain political endorsement, strengthen institutional mandates and build a cooperative data sharing environment through a shared vision and understanding of the value of an Integrated Geospatial Information Framework, and the roles and responsibilities to achieve the vision.

Summary

Geospatial information is increasingly being harnessed to interconnect and integrate government functions and commercial services - making cities more livable, citizens more engaged and informed, and agricultural areas more productive. Traffic congestion, weather reports, air pollution, bus locations, pest monitoring, flood sensors, and electricity outage applications are all underpinned by geospatial information that can be synthesized into a seamless knowledge environment so that information can be accessed quickly by users to make informed decisions. For government this means streamlining operations, reducing costs and improving overall economic and social sustainability.

This level of geospatial capability can only be achieved through cooperative governance frameworks and with strong leadership that penetrates across sectors and through all levels of government. Institutions need to work together to share information and work towards common strategic priorities and goals.

By interconnecting government functions through well-functioning governance frameworks, it is possible to bring together geospatial information from multiple sources so that it can be used seamlessly on any digital device.

Good governance and cooperative institutional arrangements are the first priority in the geospatial information reform agenda. They enable geospatial information challenges to be met head on, provide flexibility to accommodate the rapidly changing environment, and the ability to embrace community and business participation within a culture of digital reform and transformation.

Common to all governance and institutional arrangements are four key elements that are required to build a cooperative data sharing environment and an appreciation of the value of geospatial information for decision-making.

The four elements are:

- **Governance Model** - based on a geospatial strategy for the nation and facilitated by governing bodies responsible for aligning and supporting policies and laws affecting the acquisition, creation, management, use, and dissemination of geospatial information.
- **Leadership** - to formulate and sustain a national geospatial information management strategy, develop a Country-level Action Plan for implementing the Integrated Geospatial Information Framework (IGIF), and create a governance process for assuring effective management responsibilities for the enterprise.
- **Value Proposition** - that measures, monitors, and communicates the economic benefit of integrated geospatial information to national priorities including citizen and societal benefits.
- **Institutional Arrangements** - that define roles and responsibilities across government for tasks associated with all aspects of geospatial information management, including appropriate coordination, management and oversight for meeting national priorities.

These elements are underpinned by principles that promote successful governance and institutional arrangements that can be adopted by each country. The principles are put into practice through several strategic actions that deliver and strengthen participation and commitment to achieving the IGIF. Tools, such as matrices, examples and checklists, are provided in the appendices to assist countries to work through concepts and processes to successfully complete each action. The overall structure for governance and institutional arrangements is illustrated in and anchored by Figure 1.1.

When implemented the actions (and their interrelated actions¹) will enable the achievement of the four elements, which in turn will deliver significant and sustainable national outcomes and benefits for a country. These outcomes include attaining:

- Efficient planning and coordination of the government's geospatial information resources;
- Strengthened leadership, institutional mandates and political buy-in;
- A cooperative data sharing environment; and
- A shared understanding of the value of integrated geospatial information management.

¹ The interrelated actions across all Strategic Pathways are described in detail in the introductory Chapter; Solving the Puzzle: Understanding the Implementation Guide.

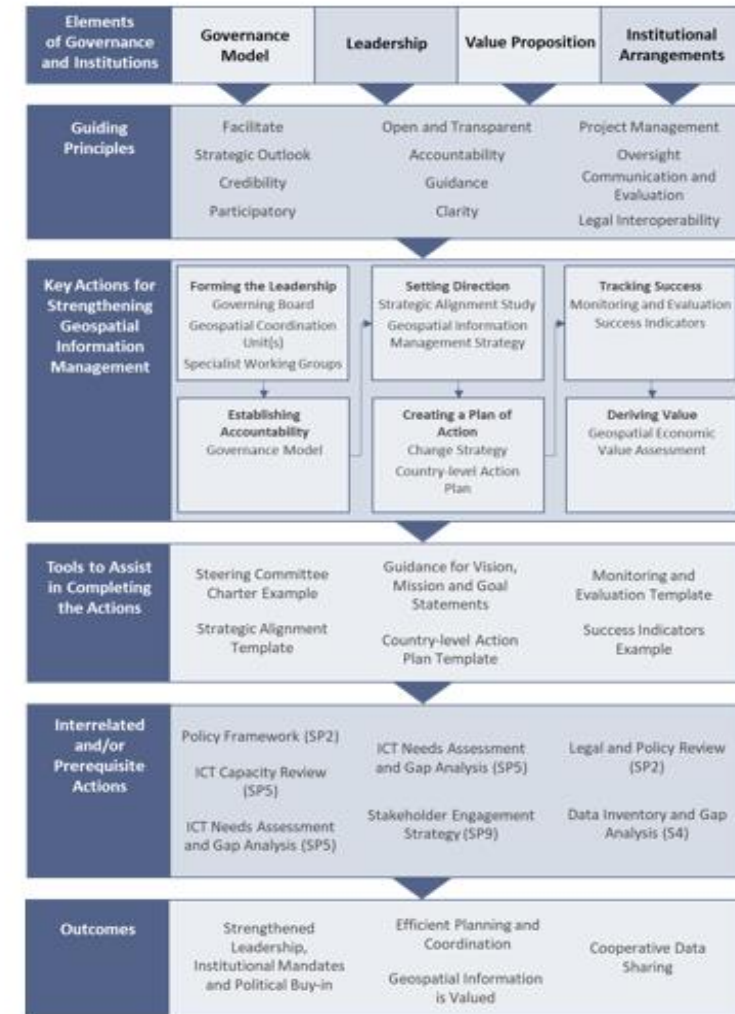

Figure 1.1: Overall structure for the Governance and Institutions Strategic Pathway - showing the four key elements, guiding principles, actions and interrelated actions, and the tools provided in the Appendices to support and achieve the outcomes.

What's Next for Cartography and GIScience?

- Where gaps and impediments prevent progress, determine what steps are needed.
- Review past research that can contribute solutions
- Identify new areas of research and development that are needed in response to recent and expected advancements and conditions
- Focus on user needs, interests, and requirements to expand the relevance of cartography and GIScience

A few ideas and opportunities to consider...

Excerpts from the article: “Contemporary American cartographic research: a review and prospective¹”

- Earth observation data are growing in interest and popularity, but challenges remain regarding its use and application potential (Nativi et al., 2015). Cartographic research is needed to better understand the characteristics of earth observation data and the potential it offers for mapping.

Excerpts continued...

- In dealing with climate change, what specialties from cartography are needed to better understand the pressures of climate change?
- Does current cartographic research sufficiently address the challenges of climate change that humanity now faces?
- ...the arrival of social media such as Flickr, Twitter, Weibo, and Facebook coupled with accurate geolocated information from cell tracking of mobile phones and embedded global navigation satellite system receivers (GNSS) have brought big social data to cartography (Crampton et al., 2013)...how are these new data and capabilities included?

Excerpts continued...

- User contributed data, such as OpenStreetmap.org, have added substantially to the background map data (Haklay, 2010). The result has been a flourishing of information visualization in cartography (Sui, 2004).
- Social media data, and some sensor data such as LiDAR point clouds, are notoriously messy, incomplete and require extensive preprocessing (Battrinca & Treleaven, 2015; Vierling, 2008).
- Much more research on cartographic data needs to focus on data quality.
- Feature-level (at the feature instance) data quality statements are needed to correctly represent accurate characteristics of data elements. Data quality assurance and the representation of uncertainty on maps remain at the forefront of cartographic research, even after 30 years of effort.

Excerpts continued...

- With new directives to create a Chief Data Scientist position in every US Federal and many academic organizations, cartographic research needs to identify the cartographic tools and methods that are needed to equip this emerging discipline to be more effective. Two areas that need more attention from the US government at many levels are cybersecurity and geospatial privacy (Andrienko & Andrienko, 2012; Iasiello, 2013).
- While visual and mapping tools have emerged...many are based on simple graphical and cartographic methods...it is more likely that future methods will automatically process data flows, and alert analysts only when new or unusual patterns emerge.

Excerpts continued...

Policy and law have largely been ignored in cartographic research in the past, but are now coming to the surface. The way in which data are designed, displayed, and interpreted could impact cartographers in the future. How can cartographic data meet the demands of data protection and privacy law? What new cartographic methods will be necessary to achieve both transparency and the protection of personal and sensitive information?

The ICA Offers a Platform for Engagement...

- For collective minds to solve real-world problems
- To advance areas of research that address age-old challenges yet to be solved

The Strength of the ICA

- **People**
 - 28 Commissions focused on specific cartographic and geospatial topics
 - 5 Working Groups created to address specific topics for the current term
- **Conferences**
 - International Cartographic Conferences (ICCs)
 - 2019 Tokyo, Japan
 - 2021 Florence, Italy
 - 2023 Cape Town, South Africa
- **Publications**
 - International Journal of Cartography (peer reviewed)
 - ICA News
 - eCARTO News
 - ICA website – www.icaci.org
 - ICC Proceedings

ICA Commissions and Working Groups

- Workshops
- Research
- Publications
- Websites
- International collaboration
- Great people

ICA conferences

Excerpts continued...

“...cartography has an opportunity to assist with the great challenges facing the world today: climate change, inequality, scarcity, and the negative environmental impacts of human settlements and industries.”

The ICA's Beginning Contributions...

- Focusing on SDG topics and challenges related to efforts by ICA Commissions
- Collaborating with the UN on a book that shows how cartography contributes to leaving no one behind
- Activated new working groups to address needs supporting What's Next
 - WG on cartography and sustainable development
 - WG on a new research agenda in cartography
 - WG on cartographic body of knowledge
 - WG on the transformation of national mapping and geospatial organizations

Ending Poverty in all its forms everywhere

THE GLOBAL GOALS

For Sustainable Development

1 NO POVERTY

Target

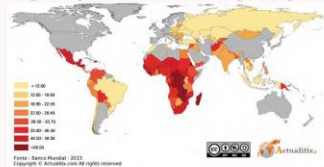

By 2030, eradicate extreme poverty for all people everywhere, currently measured as people living on less than \$1.25 a day

Indicator

Percentage of population below \$1.25 (PPP) per day

Percentage of Population below the Poverty Line, by Country

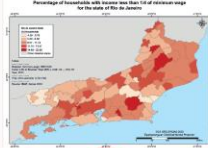

Source: Banco Mundial (2015)
Copyright © All rights reserved

Names identify topographic elements which localize the map theme

Percentage of households with income less than US\$ 1.90 a day in Brazil

Percentage of households with income less than US\$ 1.90 a day in Rio de Janeiro

The maps in this poster illustrate geographical patterns of poverty around the world and focus on the city of Rio de Janeiro, Brazil. Left a sequence of choropleth maps showing percentage of households with an income less than 1/4 of the minimum wage in Brazil (R\$10), at regional and local levels.

Right topographic and toponymic information, that is, more details about the landscape and the place names of the areas covered in the thematic maps at the same scales. Comparing the maps allows observations to be made about the patterns of poverty and its relationship with space and place. We can identify general trends, such as the low levels of income in regions within the Amazon basin and identify specific regions within the city of Rio de Janeiro which experience greater levels of poverty.

Below the combination of the thematic data with topographic data to allow efficient understanding of the relationship between poverty and place. However, poverty is an organic phenomenon and choropleth maps such as these are limited in how they present these data: they impose artificial boundaries that rarely coincide with fluid concepts and realities.

Topographic Mapping

helps us to gain a better insight into and understanding of the causes of poverty by supporting decision-making by the state (e.g. national surveys) and the empowerment of local people (e.g. community mapping). As a resource for planning, topographic maps can present the landscape as a shared resource for the benefit of all and help to conserve natural and built environments for future generations.

Toponymy

allows us to analyze the relations between and among people, history, geography and culture, space and time. Toponymy, place names or geographical names are one of the most commonly and widely used way of geoinformation, consisting of official and local names of administrative, cultural and geographic features, including streets and roads.

The ICA Commission on Topographic Mapping provides a forum for those whose primary focus is the design, production and use of topographic mapping and related geospatial data products.

The ICA Commission on Toponymy disseminates scientific knowledge in the processing and use of toponyms within geography and cartography and supports the publication of gazetteers, topographic data files and toponymic reference systems.

End hunger, achieve food security and improve nutrition and promote sustainable agriculture

2

HUNGER

THE GLOBAL GOALS

For Sustainable Development

Target

End hunger and ensure access by all people, in particular the poor and people in vulnerable situations, including infants to safe, nutritious and sufficient food all year round.
Ensure sustainable food production systems and implement resilient agricultural practices that increase productivity and production.

Indicator

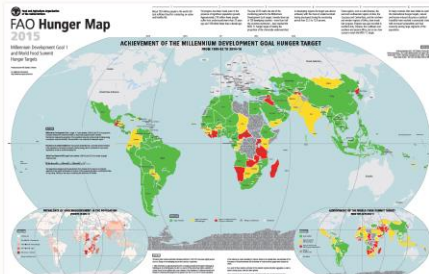

Prevalence of undernourishment (PoU)
Prevalence of population with moderate or severe food insecurity
Emissions of greenhouse gases in agriculture (per hectare of land and per unit of output).

Maps communicate spatial patterns and spatio-temporal analysis results effectively

FAO Hunger Map 2015

Millions of people (2011-2013) at risk of food insecurity

Mapping the reality of food insecurity in the World

The prevalence of undernourishment (PoU) is analysed for each country and visualized in the world map. Changes of PoU have been monitored and visually presented in the map. It is shown that the progress of reduction in number of undernourished has been made in all world regions, but at different rates.

Between the monitoring period of 1990-2015, more than 50% of the developing countries have at least halved the proportion of the chronically undernourished. But the map also shows that many countries still have not reached the international hunger target, with increased vulnerability and food insecurity among large segments of the population.

Sustainable agriculture

GIS and mapping have been used as enabling technology for sustainable agriculture and food production. The GIS and GPS-enabled mobile device technologies allow planners, agronomists and farmers to research and devise for resilient agricultural practices and better productivity. For example, emissions of greenhouse gases per hectare of land and per unit of output can be accurately estimated based on precise geolocation, observation, and measurement.

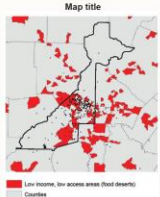

Prevalence of population with moderate or severe food insecurity at fine urban and regional scales

The prevalence of food insecurity also needs to be studied at the local level. This is often done with special consideration of the income level and people's spatial accessibility to healthy food. The mapping of the analysis results helps to identify areas where improvements are urgently needed. The maps below show such areas in Atlanta, USA.

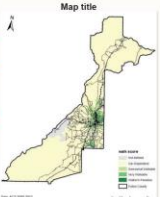

The person on the right is using a GPS-enabled mobile device to collect data on crop yields and soil moisture.
